

**REPORT
OF
DATA ANALYTICS JOB SIMULATION
INTERNSHIP**

Submitted

To

**School of Computer Science and Engineering
IILM University, Greater Noida, U.P.**

In partial fulfilment of the requirement of degree of

B.Tech CSE

By

Name of Student: ABHISHEK KUMAR

Roll Number: 2410030904

Batch: 3CSE9

Academic Session: 2026–27

CANDIDATE'S DECLARATION

I, ABHISHEK KUMAR, do hereby declare that the internship report titled “Data Analytics Job Simulation Internship” has been completed by me to fulfil the requirement for the award of the degree of Bachelor of Technology in CSE. All the references used in this report have been appropriately acknowledged. I affirm that this report is based on my internship learning and has not been submitted to any other institute for any degree or diploma requirement. I shall be solely responsible for any kind of copyright violation in this regard.

Student Name: ABHISHEK KUMAR

Roll No.: 2410030904

ACKNOWLEDGEMENT

I am grateful for the opportunity to complete the Data Analytics Job Simulation Internship at Interns of Industry. This internship provided me with practical exposure to important areas of data analytics, including exploratory data analysis, risk profiling, predicting delinquency with AI, business reporting and data storytelling, and AI-driven collections strategy.

I would like to thank the organization and everyone involved in the internship program for providing a structured learning experience and practical tasks. The internship helped me understand how data can be explored, interpreted, and communicated to support business decisions.

I also express my sincere gratitude to the School of Computer Science and Engineering, IILM University, Greater Noida, for providing academic guidance and encouraging practical learning. Finally, I thank my parents and family for their continuous support and encouragement.

4. PROJECT DESCRIPTION

4.1 Introduction

The Data Analytics Job Simulation Internship was a practical learning program focused on using data analytics and artificial intelligence concepts for business-oriented problem solving. The internship was completed at Interns of Industry from 4 June 2026 to 2 July 2026.

The program involved practical tasks in exploratory data analysis and risk profiling, predicting delinquency with AI, business reporting and data storytelling for collections strategy, and implementing an AI-driven collections strategy. These activities demonstrated how raw data can be transformed into meaningful insights that support analysis and decision-making.

The internship was particularly useful in developing an understanding of the complete analytical process: understanding a problem, exploring available data, identifying patterns and risks, applying analytical or AI-based approaches, and communicating findings through reports and data stories.

4.2 Organization Profile

The internship was completed through Interns of Industry, as stated in the internship completion certificate. The organization provided the Data Analytics Job Simulation Internship and assigned practical tasks related to exploratory data analysis, risk profiling, AI-based delinquency prediction, business reporting, data storytelling, and AI-driven collections strategy.

For the purpose of this report, the organization profile is limited to the information supported by the internship completion certificate. The internship environment focused on practical, task-based learning and the application of data analytics concepts to business and collections-related scenarios.

4.3 Problem Statement

Organizations often have large amounts of customer and business data, but the data is useful only when it is analyzed properly. In collections-related scenarios, an important challenge is to identify risk patterns, understand customer behaviour, predict the possibility of delinquency, and communicate the findings clearly for decision-making.

The problem addressed during the job simulation was therefore to use data analytics and AI-oriented thinking to explore data, perform risk profiling, support delinquency prediction, prepare business reports and data stories, and develop an AI-driven approach to collections strategy.

4.4 Project Objectives

- To understand the practical workflow of a data analytics project.
- To perform exploratory data analysis and identify useful patterns in data.
- To understand the concept of risk profiling for business and collections-related decisions.
- To explore the use of AI for predicting delinquency.
- To develop business reporting and data storytelling skills.
- To understand how analytics can support an AI-driven collections strategy.
- To improve problem-solving, analytical thinking, and professional reporting skills.

4.5 Scope of the Project

The scope of the internship covered the major stages of analytical problem solving within the job simulation. It included data exploration, interpretation of patterns, risk-oriented analysis, AI-based delinquency prediction concepts, reporting, data storytelling, and strategy development.

- Exploratory analysis of available data and identification of trends or patterns.
- Risk profiling to support the understanding of different customer or business risk categories.
- Use of AI-oriented approaches for predicting possible delinquency.
- Preparation of business-focused reports from analytical findings.
- Communication of insights through data storytelling.
- Development of an AI-driven collections strategy based on analytical understanding.

4.6 Technologies and Tools Used

The internship certificate identifies the practical tasks completed, but it does not specify the exact software tools used. Therefore, this report does not claim the use of

any particular programming language, platform, or software that is not documented in the certificate.

The learning areas involved data analytics, artificial intelligence, business reporting, and data storytelling. In a typical implementation of such tasks, tools may be selected according to the requirements of the dataset and the analytical workflow; however, specific tool usage should only be added if supported by the student's internship work records.

4.7 System Architecture

Based on the internship tasks, the following conceptual architecture represents the analytical workflow used to understand the project. This is a report-level conceptual representation of the learning process.

Stage	Purpose
Data Input	Collect or receive relevant business/customer data for analysis.
Exploratory Data Analysis	Understand data characteristics, trends, patterns, and possible issues.
Risk Profiling	Identify and organize risk-related characteristics for analytical decision-making.
AI-Based Prediction	Use predictive logic to estimate the likelihood of delinquency.
Business Reporting	Present analytical findings in a structured and understandable form.
Data Storytelling	Communicate the meaning and business impact of insights.
AI-Driven Collections Strategy	Use analytical understanding to support strategic collections actions.

Conceptual workflow: Data Input → Exploratory Data Analysis → Risk Profiling → AI-Based Prediction → Business Reporting and Data Storytelling → AI-Driven Collections Strategy.

4.8 Methodology

The internship followed a task-oriented analytical methodology. The workflow can be described in the following stages:

Step 1: Understanding the Business Context – The first stage is to understand the objective of the analytical task and the type of decision that the analysis is expected to support.

Step 2: Exploratory Data Analysis – The available data is examined to understand its structure, important variables, patterns, trends, and possible relationships.

Step 3: Risk Profiling – Relevant information is analyzed to understand different levels or characteristics of risk.

Step 4: Delinquency Prediction with AI – AI-oriented predictive concepts are applied to estimate the likelihood of delinquency using relevant patterns and information.

Step 5: Business Reporting – The important findings are organized into a report that can support business understanding and decision-making.

Step 6: Data Storytelling – Analytical results are communicated in a clear narrative so that technical findings can be understood in a business context.

Step 7: AI-Driven Collections Strategy – The analytical insights are connected to a strategic approach for collections-related decision-making.

4.9 Expected Outcomes

- Better understanding of the role of data analytics in business decision-making.
- Practical exposure to exploratory data analysis and risk profiling.
- Understanding of AI-based approaches for delinquency prediction.
- Improved ability to convert analytical findings into business reports.
- Improved communication of insights through data storytelling.
- Understanding of how analytics and AI can contribute to collections strategy.
- Development of analytical thinking and professional problem-solving skills.

Overall, the internship provided practical exposure to the relationship between data analysis, AI-oriented prediction, business communication, and strategic decision-making.

4.10 Certificates of Completion and Other Communication Proof

The Internship Completion Certificate issued by Interns of Industry is attached in this report. The certificate confirms the successful completion of the Data Analytics Job Simulation Internship during the period 4 June 2026 to 2 July 2026.

The certificate records completion of practical tasks in exploratory data analysis and risk profiling, predicting delinquency with AI, business report and data storytelling for collections strategy, and implementing an AI-driven collections strategy.
